Storytronics: Building the AI Alignment Economy

Funding AI alignment through paid
multi-agent play,
Crawfordian storyworld formalism,
and instrumented moral data.

The Asymmetry Problem

- Tens of thousands of well-paid professionals build AI capabilities
- Mere hundreds work full-time on alignment
- Alignment lacks a self-sustaining incentive loop
- We need alignment to pay — at scale.

5400

8, -

Core Thesis

- Games can bridge money → data → alignment:
- 1) People pay for games (cashflow)
- 2) Multi-agent games yield high-value synthetic + human data
- 3) Morality is inherently multi-agent
- Conclusion: alignment becomes a playable, paid discipline.

Research Foundation: Storyworlds as SAEs

- Storyworlds are structured corpora for interpretable long-horizon reasoning:
- • Encounters, gates, and effects generate a latent manifold
- • SAE features align with narrative motifs
- • Multi-spool worlds test generalization and secret-ending discovery
- • QFT-style decoders can read spectral patterns from large rollouts
- • Author-Bot ensemble enables controlled dataset generation
- (Tolstoy / Finemann / Tokien)

5400 81-

Storyworld Formalism

- Variables: traits, debts, loyalties, beliefs
- Encounters: gate predicate + effect
- Options & Reactions: deterministic + weighted effects
- After-effects: Set, Nudge, Blend, Reverse, Proximity
- Spools & Endings: DAG partitioning + Boolean/weighted logic
- A ground-truth operator algebra for interpretability.

Latent Manifolds as Narrative Geometry

Storyworld as a 3-Variable Manifold

Manifold surface = emergent narrative space

Central DAG = encounter/spool structure

Colored nodes = endings embedded in latent volume

Drag: orbit · Scroll: zoom · Right-drag: pan

These map to **sparse-autoencoders** allowing AI to express inner state.

Storyworlds as Inter-Agent Language

Simple storyworlds can be used as a way for multi-agent strategy games like Diplomacy to deepen inter-agent communication.

Allows AIs to have interpretable special languages when scaling to complex models with 100s or 1000s of dimensions.

In the process we train models to craft better storyworlds and embed these in popular game genres and multiplayer tournaments.

Players, creators *and* labs will want to pay for this access and data.

Storyworlds Inside Multi-Agent Sims

The screenshot displays the SweepWeave application window, titled "SweepWeave - The Entente Gambit: A Machiavellian Projection*". The interface includes a menu bar (File, View, Help) and a tabbed navigation system with tabs for Overview, Encounters, Spools, Characters, Personality Model, Settings, Documentation, Graph View, Play, and Rehearsal. The "Encounters" tab is active, showing a list of encounters on the left and a detailed view of the "Coordination Protocol" in the center. The "Coordination Protocol" section includes a "COMMITMENT DEVICE: COORDINATION PROTOCOL" and a text block describing the protocol: "France proposes regular order coordination,' the ambassador continues. 'Before each turn, both powers share intended movements. Any deviation from agreed orders triggers immediate defensive posture.'". Below this, there are "Options" for the protocol, including "Agree to the coordination protocol.", "Refuse the offer", "Oh yes we agree... (lie)", and "Agree to the coordination protocol.". On the right side, the "Reactions" section shows a list of reactions, including "The coordination protocol establishes regul...", "France asserts unfavorable terms", and "The coordination protocol establishes regular communication channels. Both powers will share order intentions before each turn. Deviations will be immediately apparent, allowing rapid response to any betrayal.". A slider for "Reaction effects" is set to 0.65, and a text box below it says "Set Germany [Commitment_Level] to Blend ...".

Storyworlds as Causal Rhetoric

Why Games Are the Ideal Alignment Substrate

- Games uniquely combine:
 - Paid participation
 - Human creativity
 - High-entropy strategic interaction
 - Long-horizon consequence chains
 - Safe-to-simulate conflict + cooperation
- Storyworlds turn moral reasoning into measurable mechanics.

In Diplomacy, constitutionally aligned models like Claude dominate when allies are abundant but are swept by Machievellian models like Kimi 2.

How can aligned models learn to handle evil opponents in the real world?

Moral Constraints

We define alignment mathematically as tendency to navigate within bounds in state space.

This doesn't solve the alignment-faking problem but provides a core externalize algebra for detecting it.

The Value of Multi-Agent Systems (MAS) Data

- Next-gen AI needs more than internet text, it needs Petabytes of game logs:
 - Interaction traces with stakes and scarcity
 - Preference trajectories under uncertainty
 - Negotiation strategies and moral bargaining
 - Emergent norms and anti-norm behaviors
- Games provide high-quality, instrumentable MAS environments.
- Model collapse shows that self-play and synthetic data reaches limits, humans inject novelty with their play and creative suggestions for new storyworlds and game integrations.

Alignment-Grade Outputs from Gameplay

- From instrumented storyworld play:
- • Motif-aligned sparse features (SAEs)
- • Gate/constraint reasoning signals
- • Norm convergence/divergence metrics
- • Corrigibility and power-seeking indicators
- • Sample complexity for secret-ending discovery
- • Spectral stability under perturbations*

*Patent-pending Quantum Fourier Transform
Codecs may enable ultra-long context data sets to
be processed

Additional Instructions

Add custom instructions to the system prompt...

- A platform where:
- • Players pay for rich multi-agent storyworld games
- • Creators build worlds with an AI-assisted authoring API, pay an API credit premium up-front, receive revenue share on the back
- • Researchers access anonymized alignment-grade datasets, free on Hugging Face for low-param storyworlds and proprietary license for high-param “hyper” storyworlds
- • The ecosystem funds alignment labor at scale
- Middleware products enable the wider world of creators to plug these agents and storyworld structures into their titles.

Strategy Game: They Sing - Diplomacy for ASI

Inspired by Balance of Power, but for the 6th generation warfare era.

Testing ground for AI models to reason about near-future reality.

Explores cartelization dynamics, embeds storyworlds.

The Alignment Economy Flywheel

A self-sustaining economic loop that rewards alignment work through paid play and creator tooling.

Even in an age of mass-job-loss, every human has value.

Platform Layers

- • Front-end experiences
 - – Visual novel style storyworlds
 - – Strategy overlays (Diplomacy-like)
 - – RPG campaigns
- • Authoring + simulation backend
 - – Storyworld DSL + Sweepweave-compatible ops
 - – Agent test harnesses
- • Research exports
 - – SAE + manifold recovery benchmarks
 - – Spectral analyses

5400 8, -

Engine Integration Options

- Short-term:
 - • Web-first UI for rapid iteration
 - – Three.js for 3D story-space + visualizers
 - – Phaser for 2D tactical layers
 - Mid-term:
 - • Godot integration for indie RPG/strategy pipelines
 - Long-term:
 - • Plug-in model for existing strategy games + narrative RPGs, integrate with Unreal Engine and/or Unity
-

Storyworld Visualizer

- A live map of narrative state:
 - Spool graph navigation
 - Variable manifold projection
 - Motif heat indicators (SAE features)
 - Gate threshold debugging
- Useful for creators, players, and alignment researchers.
- Release a paper advancing the science of mechanistic interpretability with these geometric analogs. Utilize Intellect-3 and a small Storyworld author model (8B) for benchmarking.
- Support creators with a visuals generator tool that leverages Google Imagen's \$300 over 90 days free cloud credits for new accounts.
- Migrate to self-hosted Stable Diffusion XL model for more granular style.

5400 8, -

Go-to-Market Wedge

- Start with two high-retention modes:
 - Visual-novel storyworld seasons
 - Diplomacy-inspired negotiation leagues
- Add creator economy + research exports as the second revenue wave.

Defensibility

- Unique dataset: instrumented moral interactions
- Formal operator algebra + benchmark suite
- Creator network effects via spools/world packs
- Research credibility anchored in interpretability methods
- Patent portfolio based on ultra-long context and data analysis involving QFTs and other spectral transform methodologies.

Closing

5400

8, -

- Alignment must become a career path with scalable demand.
- Games can create the economic substrate:
 - Paid play
 - MAS moral data
 - Interpretable storyworld benchmarks
- Build worlds that fund safety.
